Interpretive guidelines:

Positive: Indicates active or latent infection by MTB complex. May also be positive with M. kansasii, M. szulgai and M. marinum. Not positive with BCG therapy. To establish a diagnosis of active disease, correlate with clinical and radiographic data.

Indeterminate: May occur from excessive levels of gamma interferon, heterophil antibodies, anergy or handling issues. Repeat analysis is recommended.

Negative: Presumptive negative for active or latent MTB infection. False negatives may occasionally be seen with impaired immune function or testing too early after exposure.
