

MEMR Compliance Overview

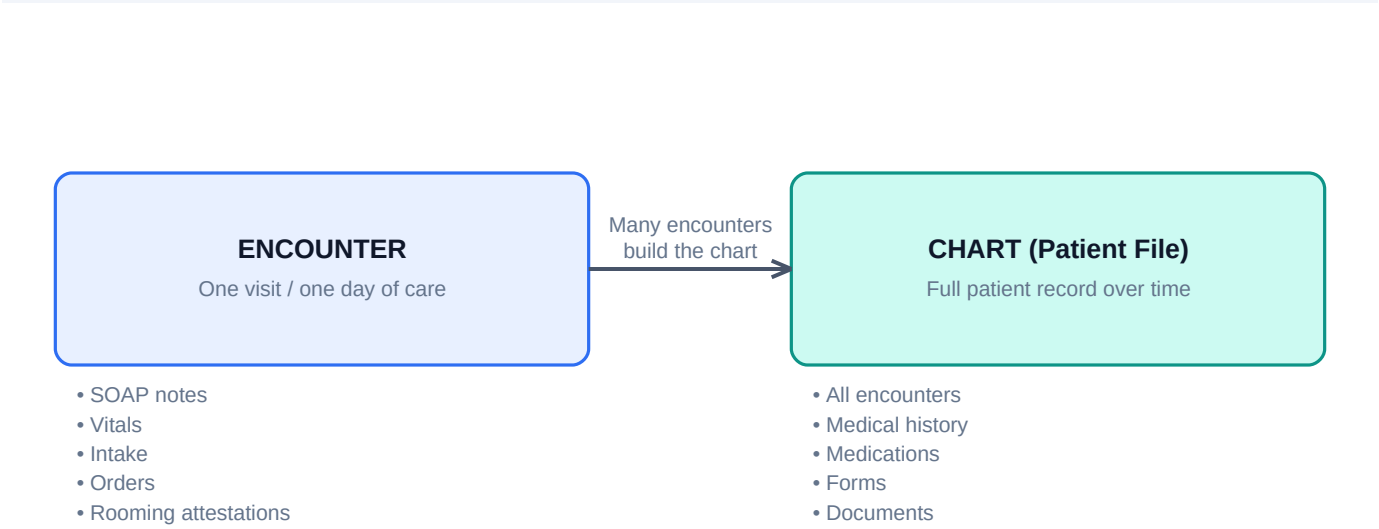

Encounters vs. Charts — Implementation Summary

MyClinicMD EMR · Meeting one-pager
Generated June 22, 2026

Purpose

Support physician oversight of NP/PA documentation (10% chart review). Track audits per visit while keeping the full patient chart available for context.

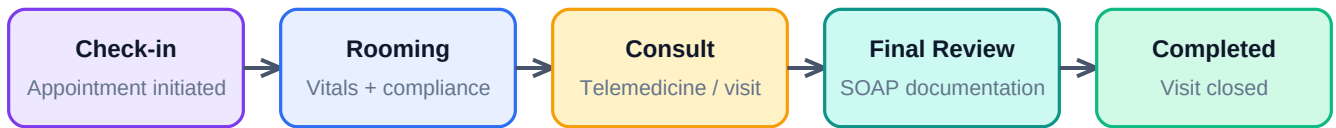

1. Encounter vs. Chart — Key Concepts

Compliance audit unit = ONE ENCOUNTER

Physician reviews NP/PA documentation per visit — not the entire chart at once.

2. Encounter Lifecycle in MEMR

Each encounter moves through this workflow independently. Status is tracked on the encounter record; timeline events are logged for audit.

Implementation Details

How encounters, charts, and compliance connect in the current build

3. Data Model

- encounters — one row per visit; status workflow, documenting_user_id (NP/PA who documented)
- encounter_physician_reviews — one audit row per encounter when NP/PA documentation requires MD oversight
- Patient File (chart) — aggregates all encounters, history, meds, forms, and uploaded documents for one patient
- Review statuses: pending | reviewed | consult_concluded | physician_signed

4. When Audit Rows Are Created

When an FNP or PA finishes encounter documentation (encounter completed, final review, or telemedicine wrap-up), the system:

- Identifies the documenting provider from encounter assignment and role
- Sets documenting_user_id on the encounter
- Creates a pending review row if one does not already exist

MD-documented visits do not create audit rows.

5. Compliance Dashboard

- Routes: /admin/compliance and /dashboard/compliance
- KPIs: total NP/PA encounters, required reviews (10%), completed, remaining, compliance %, pending, overdue
- Provider table: per-NP/PA breakdown by clinic
- Pending queue: patient, encounter date, days pending (overdue after 7 days), chief complaint
- Review drawer: full SOAP, audit notes, findings, mark review complete
- Link to Patient File for full chart review beyond that visit

6. 10% Compliance Rule

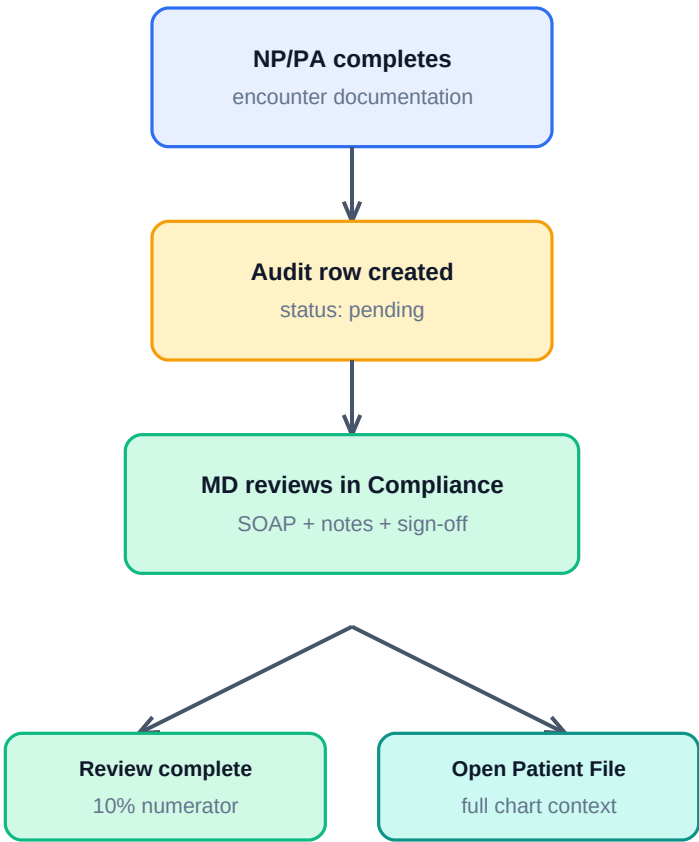

```
Required = ceil(NP/PA encounters in period × 10%)
Completed = reviews marked reviewed / consult_concluded / physician_signed
Compliance % = completed ÷ required
```

7. Rooming & Compliance (per encounter)

Separate from the 10% audit — rooming attestations captured on each encounter: identity verified, prescribing location, MA supervision, ready for doctor, pharmacy, consent timestamps, MA exam findings.

Review Workflow & Access

8. Physician Review Flow

9. Who Can Access Compliance

Role	Dashboard	Can complete reviews
Admin	Yes — all locations	Yes
Doctor (MD)	Yes — if compliance_access enabled	Yes (intended reviewer)
FNP / PA	Yes — if compliance_access enabled	Yes (typically view own metrics)
Nurse	No	No

10. Encounter vs Chart — Discussion Points

- An encounter is the unit of clinical workflow and documentation for a single visit.
- A chart is the longitudinal patient record — many encounters plus static history and documents.
- Compliance selects which encounters need MD review; Patient File provides full chart context.
- Additive design: legacy encounters unchanged; audit is a parallel track on new NP/PA visits.

11. Demo Path (2 minutes)

- Complete an encounter as NP/PA !' pending review row appears
- Open Compliance !' see KPIs and pending queue
- Review encounter !' read SOAP, add notes, mark complete

- Open Patient File !' full chart for same patient
